

SLA, commercial performance and risk schedule

Service and commercial commitments

This fictional schedule applies to Internal courier and distribution, supplied by Quenora Logistics, for service SVC-019 under CTR-019. All thresholds and credit rates are invented for the demo and are not taken from a real supplier agreement.

Measure	Target / method	Evidence and owner
Primary service measure	98.0% on-time service completion per calendar month	Time or service-order record; Logistics owner
Priority 1 acknowledgement	60 minutes	Incident log; supplier service lead
Priority 1 restoration objective	240 minutes, subject to evidenced scope/dependencies	Recovery runbook and owner validation
Invoice accuracy	99.0% of invoiced lines match approved price and scope	Finance reconciliation; commercial owner
Monthly reporting	By fifth business day of following month	Accepted service report

Primary metric calculation: $100 \times (\text{eligible units minus failed units}) / \text{eligible units}$. Units are service orders. Only pre-approved, recorded exclusions can change the denominator; supplied observations have zero exclusions.

Incident priority is assigned using business impact. The customer and supplier agree the affected service before applying a remedy. Acknowledgement and restoration objectives are separate from the monthly primary metric.

Measurement scope includes only this contracted service. Upstream failures still require coordination and evidence; they are not silently deleted from records.

SLA, commercial performance and risk schedule (continued)

Measured performance and credit illustration

Month	Eligible / failed	Actual %	Target %	Est. credit USD
2026-06	4000 / 40	99.0	98.0	\$0.00
2026-07	4000 / 40	99.0	98.0	\$0.00
2026-08	4000 / 140	96.5	98.0	\$3,208.33

Invented credit policy: when the primary result misses target by less than 1 percentage point, estimate 3% of the affected monthly fee; at a shortfall of at least 1 percentage point, estimate 7%. No primary breach means zero credit. Total monthly remedies are capped at 15% of the affected service fee, and overlapping incidents are not double-counted.

Fee basis for the above illustration: \$45,833.33 USD per month. Claims must identify the service, measurement period and source records within 45 days after month end. The customer reviewer validates exclusions, entitlement and fee basis before accepting a claim.

Estimated credits are not approved refunds and have not been posted into the closed FY2025 finance ledger. The JSON measurement rows preserve the numerator, denominator, target, calculation and credit status.

The acknowledgement and invoice-accuracy targets are commitments only; this fixture does not invent measured results for them. Missing observations must be reported as not measured.

Risk assessment, controls and review

Field	Recorded state
Assessment ID	RA-019
Assessment date	2026-08-15
Assessment freshness	Current
Risk tier	Low
Data classification	Internal synthetic
Finding	Alternate staffing evidence incomplete
Issue status / severity	Closed / Medium
Due date / owner	2026-10-28 / OWN-019
Control ID	CTRL-019

Control purpose: maintain evidence of recovery capability or alternate staffing and a named owner. Open and overdue findings constrain transition recommendations. Closed findings retain historical evidence and do not become newly open solely because a reporting period changes.

A risk assessment older than 365 days is stale under this fictional policy. A missing assessment has no assigned tier; the system must not silently substitute a low-risk rating. The original tier of a stale assessment remains historical evidence, not a current approval.

Human review: commercial owner validates claims and clauses; service owner validates continuity and dependencies; risk owner reviews open findings. The solution may recommend options but never renew, offboard or approve a supplier automatically.
